Description:

Shark Cartilage Powder (SCP) for horses is a nutritional supplement produced from 100% shark cartilage, which are commercially caught in the pristine coastal waters of New Zealand. (SCP) is an excellent source of Chondroitin Sulphates, Calcium and Phosphorus.

Sharks are known to have a very effective immune system. Wounds heal rapidly and Sharks are largely free of infections. (SCP) is also high in nutritional value, containing Mucopolysaccharides, Thrombospondin and an ingredient of Anti-angiogenesis which strenghtens the horses bone structure as ageing occurs.

These natural properties of (SCP) are extremely beneficial to horses with joint problems. (SCP) improves joint function by helping to regenerate worn cartilage in arthritic joints.

(SCP) should also be supplemented into your horses diet as a preventative measure against arthritic conditions.

As a nutritional product, (SCP) can function as a rejuvenating agent in expediting body repair in cases of illness, injury or trauma.

Research at several universities is now revealing how (SCP) can function to rebuild and repair inflamed and damaged joints and connective tissue.

(SCP) has been found beneficial in reducing pain, stiffness and inflammation in the afflicted areas as well as increasing joint mobility.

Suggested use:

The initial dosages for a 1,100 pound horse should be 9 - 10 grams a day. Lower dosages usually yield less obvious responses. It is more cost efficient to begin with these dosages and attempt tapering later than to feed the lower dose for four weeks, only to find you need to increase it to tell if the product helps.

On the other hand, exceeding this dosage does not appear to result in further improvement.

(SCP) can be mixed with several other natural products, such as raw oats to enhance palatability and for ease of administration.
